

the effective and non-poisonous way to get rid of ants by killing them off within 48 hours or less

this mixture is far less toxic than table salt!

ingredients:

500ml distilled water [ants don't really like fluoride, chloride etc.]

2 cups of sugar [ordinary white]

1 heaped tablespoon boric acid [get from pharmacy, hardware shop or supermarket]

instruction for making:

heat water to about 45 degrees [warm]

mix in sugar and boric acid until dissolved

instruction for use:

take cotton wool ball and dip it in the fluid.

place the soaked cotton wool ball on a trail of ants [the more ants on the trail the better]

mode of action:

the ant has two stomachs. a 'personal' and a 'social' stomach. it consumes the sweet liquid [not noticing the tasteless boric acid] and takes the liquid to the nest, feeding the queen, the soldiers and the antlings [baby ants] from its social stomach. within about 12-36 hours the boric acid dissolves the gut [stomach] lining of those ants who ingested the liquid and they die.

result:

if enough of the poison is taken to the nest, the ants in the nest will start to die, which might include the queen who is responsible for producing thousands of ants. your ant problem will be temporarily solved. soon ants will be back though, but you still have a lot of poison or can make more.

[for more on ants look here](#)

this mixture will also kill cockroaches, termites, fish moths, crickets etc

take note, as with any substance which is not made for human consumption, this mixture should be marked and kept out of reach of children as it is very sweet and might be mistaken for cool drink!
